

CS 418 Project Proposal

Project name and Github

Project name: The Analysis Of Online and Offline Course Effectiveness

Motivation: This project aims to analyze which type of course--online or in-person—is more beneficial for student development in a university.

GitHub handle: yutinglu103

Problem

I recently noticed that some courses offer both online and in-person options. When selecting courses, I recently noticed that some courses offer both online and in-person options and found myself confused about which format would be more beneficial for my learning. So, I tried to communicate with others and found the most of students have same confused.

To solve this problem, our goal is to get the relationship between the development of students and the type of course. Based on these results, students can choose the course format that suits them best, whether it's online or in-person.

From my perspective, we hypothesize that in-person classes might lead to better outcomes due to face-to-face interaction and focused learning environment.

Data

I plan to use 2 sources of data:

1. The UIC's academic records.

Note: I plan to apply this data from school, I am not sure how much time will I need.

2. The questionnaire from students.

Note: I plan to complete it in 2-3 weeks.

For both online and offline formats, the data will include students' grades, attendance records and course feedback from the students. I also plan to select multiple courses to ensure the accuracy of the results.

Solution

To approach the problem, I plan to compare the data from both online and in-person course. The next step, I will try to collect the relate data in the Paragraph 3. The system will be static. Finally, I hope the final report will include charts with the analyzed data, as well as visual icons to help convey the results.

I will use the following techniques to analyze the data:

1. Pandas
2. Matplotlib
